## MAT0028 ~ Lesson 22

Work the following examples as you listen to the recorded lecture.

## Slope Rule for Linear Equations

Slope of a linear equation is really the direction of the line. We also think of slope as the slant or steepness of a line, and it can be measured. As you have seen in earlier instruction, slope is equal to the vertical change in a line (called the rise) over the horizontal change (called the run). Therefore you may think of slope as the change in $y$ over the change in $x$. Since we can define and measure slope in terms of changes in $y$ and $x$, we can also calculate slope from two points on the same line. Take a close look at the following examples:

| $\frac{\text { Iwo Points on a Line }}{(3,1) \text { and }(4,-2)}$ | Calculations for Slope <br> $\boldsymbol{m}=\frac{-\mathbf{2 - 1}}{\mathbf{4 - 3}}=\frac{-\mathbf{3}}{\mathbf{1}}=-\mathbf{3}$ <br> $(-2,0)$ and $(1,5)$ <br> $\boldsymbol{m}=\frac{\mathbf{5 - 0}}{\mathbf{1}-(-\mathbf{2})}=\frac{\mathbf{5}}{\mathbf{3}}$ <br> $(4,3)$ and $(-1,-2)$ <br> $\boldsymbol{m}=\frac{-\mathbf{2 - 3}}{-\mathbf{1}-\mathbf{4}}=\frac{-\mathbf{5}}{-\mathbf{5}}=\mathbf{1}$ <br> $(0,6)$ and $(4,-2)$ <br> $\boldsymbol{m}=\frac{\mathbf{- 2}-\mathbf{6}}{\mathbf{4 - 0}}=\frac{\mathbf{- 8}}{\mathbf{4}}=-\mathbf{2}$ $\mathbf{l}$ |
| :--- | :--- |

Use the Slope Rule to calculate the slope for the following lines.

| $\frac{\text { Two Points on a Line }}{}$ | Calculations for Slope |
| :--- | :--- |
| $(4,3)$ and $(-1,-2)$ | $\boldsymbol{m}=$ |
| $(0,6)$ and $(4,-2)$ | $\boldsymbol{m}=$ |
| $(2,-1)$ and $(3,-6)$ | $\boldsymbol{m}=$ |
| $(5,0)$ and $(-4,2)$ | $\boldsymbol{m}=$ |
